Paper 1 Multiple Choice

**45 minutes**

Additional Materials: Multiple Choice Answer Sheet

**READ THESE INSTRUCTIONS FIRST**

Write in soft pencil.

Do not use staples, paper clips, glue or correction fluid.

Write your name, class and index number on the Answer Sheet and question paper, in the spaces provided.

 There are **thirty** questions on this paper. Answer **all** questions. For each question there are four possible answers **A, B, C, and D**.

 Choose the **one** you consider correct and record your choice in **soft pencil** on the separate Answer Sheet.

Each correct answer will score one mark. A mark will not be deducted for a wrong answer.

Any rough working should be done in this booklet.

 A copy of the Periodic Table is printed on **page 14**.

The use of an approved scientific calculator is expected, where appropriate.

**Read the instructions on the Answer Sheet very carefully.**

| For Examiner's Use |    |
|--------------------|----|
| Total              | 30 |

 This document consists of **13** printed pages and **1** blank page.

1. The diagrams show two methods of collecting gases.

Which row gives the properties of a gas that can be collected by both methods?

|          | property 1         | property 2          |
|----------|--------------------|---------------------|
| <b>A</b> | insoluble in water | denser than air     |
| <b>B</b> | insoluble in water | less dense than air |
| <b>C</b> | soluble in water   | denser than air     |
| <b>D</b> | soluble in water   | less dense than air |

2. A substance has a melting point of  $-179\text{ }^{\circ}\text{C}$  and a boiling point of  $-106\text{ }^{\circ}\text{C}$ .

What are this physical states at  $-150\text{ }^{\circ}\text{C}$  and  $-100\text{ }^{\circ}\text{C}$  respectively?

|          | $-150\text{ }^{\circ}\text{C}$ | $-100\text{ }^{\circ}\text{C}$ |
|----------|--------------------------------|--------------------------------|
| <b>A</b> | gas                            | gas                            |
| <b>B</b> | liquid                         | gas                            |
| <b>C</b> | liquid                         | liquid                         |
| <b>D</b> | solid                          | liquid                         |

3. A substance is in a state in which its particles are widely spaced and able to move freely. It changes to a state in which its particles are close together but still able to move freely.

What is this change called?

- A** boiling
- B** condensation
- C** evaporation
- D** freezing

4. The table shows the colours and solubilities of four solids.

| solid | substance | boiling point / °C |
|-------|-----------|--------------------|
| W     | white     | insoluble          |
| X     | white     | soluble            |
| Y     | green     | insoluble          |
| Z     | green     | soluble            |

A mixture containing two of the solids is added to excess water, stirred and filtered. A colourless filtrate and green residue are obtained.

Which two substances are present in the mixture?

- A W and Y  
 B W and Z  
 C X and Y  
 D X and Z
5. Samples of tinned apricots, beans, corn and tomatoes are tested for additives by using chromatography. The chromatograms are compared with those of three artificial additives, P, Q and R. The results are as follows.

Which tinned food does not contain any artificial additives?

- A apricots  
 B beans  
 C corn  
 D tomatoes

6. Methanol boils at 65 °C and water boils at 100 °C. Methanol and water are completely miscible with each other.

Which method is used to separate a mixture of these two liquids?

- A evaporation
- B filtration
- C fractional distillation
- D paper chromatography

7. Which atom has twice as many neutrons as protons?

8. Which statement about a covalent molecule is correct?

- A It can be formed between two metal atoms.
- B It has a giant lattice structure.
- C It has a low boiling point.
- D It is able to conduct electricity in aqueous solution.

9. The electronic structures of atoms P and Q are shown.

P and Q combine together to form a compound.

Which row describes the type of bonding and the formula of the compound?

|   | type of bonding | formula              |
|---|-----------------|----------------------|
| A | covalent        | $\text{P}_2\text{Q}$ |
| B | covalent        | $\text{PQ}_2$        |
| C | ionic           | $\text{P}_2\text{Q}$ |
| D | ionic           | $\text{PQ}_2$        |

10. Which pair of elements form a compound by sharing electrons?

- A carbon and fluorine
- B lithium and chlorine
- C neon and oxygen
- D potassium and nitrogen

11. The diagram shows a molecule.

Key

- : carbon
- : hydrogen
- ▨ : nitrogen
- : oxygen

What is the molecular formula of this molecule?

- A  $(\text{NH}_2)_2\text{CO}$
- B  $(\text{CH}_2)_2\text{NO}$
- C  $\text{CH}_2\text{N}_2\text{O}$
- D  $(\text{OH}_2)_2\text{CN}$

12. The table below gives information about three indicators.

| indicator        | colour change<br>low pH $\rightarrow$ high pH | pH at which colour<br>change takes place |
|------------------|-----------------------------------------------|------------------------------------------|
| methyl orange    | red $\rightarrow$ yellow                      | 4                                        |
| bromothymol blue | yellow $\rightarrow$ blue                     | 6.5                                      |
| phenolphthalein  | colourless $\rightarrow$ pink                 | 9                                        |

If equal volumes of these three indicators were mixed, which colour would be observed at pH 5?

- A blue
- B colourless
- C pink
- D yellow

13. Ammonia may be obtained from ammonium chloride by heating with

- A aqueous calcium chloride.
- B aqueous sodium hydroxide.
- C dilute hydrochloric acid.
- D water.

14. The graph shows how the pH changes as an acid is added to an alkali.

Which letter represents the area of the graph where both acid and salt are present?

15. Which substance does not react with dilute sulfuric acid to produce magnesium sulfate?

- A magnesium
- B magnesium carbonate
- C magnesium nitrate
- D magnesium oxide

- 16 The electronmicrograph shows part of a plant tissue.

Which structure is a partially permeable membrane?

- 17 Leaves have different levels of organisation.

Which row describes the leaf, leaf mesophyll and leaf epidermis?

|   | leaf   | leaf mesophyll | leaf epidermis |
|---|--------|----------------|----------------|
| A | organ  | cell           | tissue         |
| B | organ  | tissue         | tissue         |
| C | organ  | tissue         | cell           |
| D | tissue | cell           | cell           |

- 18 A piece of plant tissue is transferred from a beaker of water into a concentrated sugar solution.

Which row correctly describes what happens?

|   | movement of water | volume of tissue cells |
|---|-------------------|------------------------|
| A | enters the cells  | decreases              |
| B | enters the cells  | increases              |
| C | leaves the cells  | decreases              |
| D | leaves the cells  | increases              |

- 19 A food is known to contain reducing sugar and protein.

When this food is tested for reducing sugar and protein, what colours would a student observe?

|          | reducing sugar test | protein test |
|----------|---------------------|--------------|
| <b>A</b> | blue                | blue         |
| <b>B</b> | blue                | lilac        |
| <b>C</b> | brick-red           | blue         |
| <b>D</b> | brick-red           | lilac        |

- 20 A student added a protease enzyme to six test-tubes each containing the same volume of protein. The tubes were kept at different temperatures.

The time taken for the digestion of the protein is shown in the table.

| temperature / °C | time / minutes |
|------------------|----------------|
| 15               | 26             |
| 25               | 12             |
| 35               | 8              |
| 45               | 4              |
| 55               | 6              |
| 65               | not completed  |

What was the optimum temperature for the action of protease?

- A** 15 °C
- B** 35 °C
- C** 45 °C
- D** 55 °C

- 21 The diagram shows the human alimentary canal.

Where is bile made, where is it stored and where does it act?

|   | where it is made | where it is stored | where it acts |
|---|------------------|--------------------|---------------|
| A | P                | Q                  | T             |
| B | P                | T                  | S             |
| C | Q                | R                  | P             |
| D | Q                | S                  | R             |

- 22 The hepatic portal vein carries the blood from the

- A heart to the small intestine.
- B large intestine to the heart.
- C liver to the large intestine.
- D small intestine to the liver.

- 23 Under which conditions will a plant photosynthesise the fastest?

|   | carbon dioxide concentration / % | temperature / °C |
|---|----------------------------------|------------------|
| A | 0.01                             | 5                |
| B | 0.01                             | 25               |
| C | 0.04                             | 5                |
| D | 0.04                             | 25               |

- 24 The diagrams show a plant in a flask of water. It is left in warm sunshine for six hours.

What explains the results after six hours?

- A absorption of water into the root hairs
  - B evaporation of water from the flask
  - C photosynthesis in the leaves of the plant
  - D transpiration from the leaves of the plant
- 25 The diagram shows a section of a stem.
- Which labelled tissue transports water and inorganic salts towards the leaves?

- 26 The diagram shows the double circulation of blood.

Which row in the table best describes the oxygen levels of the blood in the sites labelled 1 to 4?

|          | 1    | 2    | 3    | 4    |
|----------|------|------|------|------|
| <b>A</b> | high | low  | low  | high |
| <b>B</b> | high | low  | low  | low  |
| <b>C</b> | low  | high | high | high |
| <b>D</b> | low  | high | high | low  |

- 27 The diagram shows changes in pressure in the aorta and the left ventricle during one complete heart beat.

What causes the increase in pressure at point X?

- A** contraction of the left atrium
- B** contraction of the left ventricle
- C** contraction of the right atrium
- D** contraction of the right ventricle

28 Some functions of the blood are listed.

- 1 antibody production
- 2 clot formation
- 3 oxygen transport
- 4 phagocytosis

Which functions are carried out by the white blood cells?

- A 1 and 3
- B 1 and 4
- C 2 and 3
- D 2 and 4

29 Which substance is produced in both aerobic respiration and anaerobic respiration in humans?

- A carbon dioxide
- B ethanol
- C lactic acid
- D water

30 The diagram shows a section through an alveolus and a blood capillary.

What best describes the oxygen concentrations at X, Y and Z?

|   | X    | Y    | Z    |
|---|------|------|------|
| A | high | low  | high |
| B | high | low  | low  |
| C | low  | high | high |
| D | low  | high | low  |

End of Paper

**BLANK PAGE**

## The Periodic Table of Elements

| Group                                                                                                |                             |                            |                             |                                 |                              |                              |                              |                            |                              |                                |                               |                               |                             |                             |                              |                               |                              |

 Secondary 3 Express

NAME

CLASS

INDEX NO.

**SCIENCE BIOLOGY****5078/4**

Paper 4

**1 hour 15 minutes**

Candidates answer on the Question Paper.

Additional Materials: NIL

**READ THESE INSTRUCTIONS FIRST**

Write your name, class and register number on all the work you hand in.

Write in dark blue or black pen on both sides of the paper.

You may use a soft pencil for any diagrams, graphs, tables or rough working.

Do not use staples, paper clips, highlighters, glue or correction fluid.

**Section A**Answer **all** questions in the spaces provided on the Question Paper.**Section B**Answer any **two** questions in the spaces provided on the Question Paper.

At the end of the examination, fasten all your work securely together.

The number of marks is given in brackets [ ] at the end of each question or part question.

| For Examiner's Use |    |
|--------------------|----|
| Total              | 65 |

This document consists of **18** printed pages.

**Section A (45 marks)**

Answer all questions in the spaces provided.

- 1 Fig. 1.1 shows three cheek cells seen under a light microscope.

**Fig. 1.1**

- (a) Name the structures labelled X, Y and Z in Fig.1.1.

X .....

Y .....

Z ..... [3]

- (b) (i) Describe one way in which the structure of a red blood cell is different from these cheek cells.

.....

.....

..... [1]

- (ii) How does this difference help the red blood cells to carry out their function?

.....

.....

.....

.....

..... [2]

- (iii) Describe two other ways the red blood cell is specialised to carry out its function.

.....

.....

.....

.....

..... [2]

- (c) In the body, red blood cells have a much shorter lifespan than cheek cells.

Use ideas about the different structures of these cells to suggest why.

.....

.....

.....

..... [2]

[total: 10]

- 2 Fig. 2.1 shows a cross-section through a dicotyledonous leaf.

Chloroplasts absorb light energy for the process of photosynthesis.

Fig. 2.1

- (a) Write a word equation for the process of photosynthesis.

..... [1]

- (b) Describe how the products of photosynthesis are removed from the leaf.

.....  
 .....  
 .....  
 .....  
 ..... [2]

- (c) Describe and give an explanation for the distribution of chloroplasts in the palisade layer and spongy layer of this leaf.

.....

.....

.....

.....

.....

.....

.....

[2]

[total: 5]

- 3 Fig. 3.1 shows some of the organs which urea travels through in the body.

Fig. 3.1

- (a) (i) Name the blood vessels labelled **S**, **T** and **U**.

**S** .....

**T** .....

**U** ..... [3]

- (ii) Using the information in Fig. 3.1, describe one way that blood vessel **T**, which is a vein, is different from most other veins.

.....

.....

.....

..... [1]

- (b) State **two** functions of the liver that are not shown in Fig. 3.1.

.....  
.....  
.....  
..... [2]

- (c) Food is digested in the small intestine.  
Use the 'lock and key' hypothesis to describe how amylase digests starch in the small intestine.

.....  
.....  
.....  
.....  
.....  
.....  
.....  
.....  
.....  
..... [4]  
[total: 10]

- 4 Fig.4.1 shows the external features of the human heart and some of its blood vessels.

Fig. 4.1

- (a) Describe the differences between the structures **W** and **Y**, as well as identifying these structures, as shown in Fig. 4.1.

.....

.....

.....

.....

.....

..... [3]

- (b) Place an **X** on Fig. 4.1 to show a blood vessel that becomes blocked (occluded) when an individual suffers from coronary heart disease. [1]

- (c) Describe three possible causes of coronary heart disease.

.....

.....

.....

.....

.....

.....

.....

..... [4]

- (d) Describe the main functions of the following cells.

- (i) red blood cell

.....

..... [1]

- (ii) white blood cell

.....

..... [1]

[total: 10]

- 5 An athlete monitors his heart rate whilst exercising on a running machine.

The results of this experiment are shown in the Table 5.1.

**Table 5.1**

|                               |    |     |     |     |     |     |
|-------------------------------|----|-----|-----|-----|-----|-----|
| running speed in km/h         | 2  | 4   | 6   | 8   | 12  | 14  |
| heart rate in beat per minute | 84 | 102 | 120 | 140 | 177 | 196 |

- (a) (i) Plot these results on the grid provided below. [2]

- (ii) Draw a line of best fit. [1]

- (b) Use your graph to predict the heart rate of this athlete when he is running at a speed of 10 km/h.

heart rate = ..... beats per minute. [1]

- (c) The heart pumps the blood around the body.

Describe how a red blood cell in the right atrium is transported to the aorta, through the heart.

.....  
.....  
.....  
.....  
.....  
.....  
..... [3]

- (d) Oxygen supplied by blood is used for aerobic respiration in body cells.

- (i) Write a word equation for aerobic respiration.

..... [1]

- (ii) Use the ideas about aerobic respiration to explain the shape of the graph you have drawn in (a).

.....  
.....  
.....  
..... [2]

[total: 10]

## Section B (20 marks)

Choose any **two** questions and answer in the spaces provided.

- 6 (a) Define osmosis.

.....

.....

.....

..... [3]

- (b) A red blood cell and an onion epidermal cell are each placed in distilled water for 60 minutes.

Table 6.1 shows the appearance of these cells at the beginning and the appearance of the onion cell 60 minutes after immersion.

Table 6.1

| cell                 | appearance of cell                                                                  |                                                                                                   |
|----------------------|-------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|
|                      | cell at beginning                                                                   | cell after 60 minutes in distilled water                                                          |
| red blood cell       |  | <b>P</b>                                                                                          |
| onion epidermal cell |  | <b>Q</b><br> |

- (i) Explain the appearance of the onion epidermal cell in box Q.

.....

.....

.....

.....  
 ..... [2]

(ii) In Table 6.1, draw the appearance of the red blood cell in box P. [1]

(c) In a second test, a red blood cell and an onion epidermal cell are each placed in concentrated sugar solution for 60 minutes.

Table 6.2 shows the appearance of these cells at the beginning and the appearance of the red blood cell after 60 minutes of immersion.

**Table 6.2**

| cell                 | appearance of cell                                                                  |                                                                                                  |
|----------------------|-------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------|
|                      | cell at beginning                                                                   | cell after 60 minutes in distilled water                                                         |
| red blood cell       |   | <b>R</b><br> |
| onion epidermal cell |  | <b>S</b>                                                                                         |

(i) Explain the appearance of the red blood cell in box R.

.....  
 .....  
 .....  
 .....  
 ..... [2]

(ii) In Table 6.2, draw the appearance of the onion epidermal cell in box S, labelling the appropriate structures. [2]

[total: 10]

- 7 Fig 7.1 shows how the rate of respiration and the rate of photosynthesis in a plant changed during a 24 hour period.

The chemical reaction for respiration in plants is identical to that of humans.

Fig. 7.1

- (a) Compare the way that the rates of these two reactions change during the period.

Describe and explain the changes that take place.

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

..... [6]

- (b)**    Photosynthesis produces glucose and respiration uses glucose.

Using information from Fig. 7.1, compare the production and the use of glucose in this plant.

Describe how the use of glucose produced by photosynthesis changes during the 24-hour period.

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

..... [4]

[total: 10]

- 8 A student uses the apparatus in Fig. 8.1 to investigate the rate of water loss from a leafy shoot.

Fig. 8.1

She measures the distance moved by the meniscus after five minutes at different temperatures.

She uses the same conditions of humidity and light intensity.

Her results are shown in table 8.1.

Table 8.1

| temperature / °C | distance moved by meniscus / mm |
|------------------|---------------------------------|
| 10               | 28                              |
| 20               | 32                              |
| 30               | 37                              |
| 40               | 44                              |
| 50               | 53                              |

- (a) (i) Describe, in detail, what the table 8.1 shows about water loss from the leafy shoot.

.....

.....

.....

.....

..... [2]

- (ii) Explain why temperature has this effect.

.....  
 .....

- (b) (i) The student covers only the lower surface of the leaves with grease.

She then repeats her measurement at 30 °C.

Briefly describe how the water loss in this experiment would compare with the water loss at 30 °C in the original experiment.

.....

- (ii) The student covers only the upper surface of the leaves with grease.

She then repeats her measurement at 30 °C.

Briefly describe how the water loss in this experiment would compare with the water loss at 30 °C in the original experiment.

.....  
 .....  
 ..... [1]

- (iii) Use your knowledge of leaf structure to explain your answers in (b)(i) and (b)(ii).

.....  
 .....  
 .....  
 .....  
 .....  
 ..... [2]

- (c) The student kept a constant light intensity during her investigation.

Predict and explain the effect that increasing light intensity has on water loss from leafy shoots.

**TANGLIN SECONDARY SCHOOL**  
**END-OF-YEAR EXAMINATION 2019**  
 Secondary 3 Express

NAME

**MARK SCHEME**

CLASS

INDEX NO.

**SCIENCE BIOLOGY****5078/4**

Paper 4

**1 hour 15 minutes**

Candidates answer on the Question Paper.

Additional Materials: NIL

**READ THESE INSTRUCTIONS FIRST**

Write your name, class and register number on all the work you hand in.  
 Write in dark blue or black pen on both sides of the paper.  
 You may use a soft pencil for any diagrams, graphs, tables or rough working.  
 Do not use staples, paper clips, highlighters, glue or correction fluid.

**Section A**Answer **all** questions in the spaces provided on the Question Paper.**Section B**Answer any **two** questions in the spaces provided on the Question Paper.

At the end of the examination, fasten all your work securely together.  
 The number of marks is given in brackets [ ] at the end of each question or part question.

**For Examiner's Use****Total****65**This document consists of **18** printed pages.

| Ans | B | B | C | D | C | B | D | B |
| Ans | D | D | D | C | B | A | C |   |

|   |     |                                                                                                                                                   |   |
|---|-----|---------------------------------------------------------------------------------------------------------------------------------------------------|---|
| 1 | (a) | X: nucleus                                                                                                                                        | 1 |
|   |     | Y: cell membrane                                                                                                                                  | 1 |
|   |     | Z: cytoplasm                                                                                                                                      | 1 |
|   |     |                                                                                                                                                   | 1 |
|   |     |                                                                                                                                                   | 1 |
| 2 | (b) | (i) RBC has no nucleus while cheek cells have a nucleus                                                                                           | 1 |
|   |     | RBC has a circular, biconcave shape while cheek cells have irregular shape                                                                        | 1 |
|   |     | (ii) RBC with no nucleus, has more room for cytoplasm, therefore more haemoglobin packed into RBC, able to transport more oxygen around the body. | 1 |
|   |     | RBC's biconcave shape allows the RBC to be squeezed through narrow capillaries and become bell-shaped                                             | 1 |
|   |     | (iii) RBC contain haemoglobin – which binds with oxygen to transport oxygen from the lungs to all parts of the body.                              | 1 |
|   |     | [one of the answer from (ii) which was not stated in (ii)]                                                                                        | 1 |
|   |     | (c) Due to lack of nucleus, the RBC has a shorter lifespan as it is not able to reproduce on its own.                                             | 1 |
|   |     | RBC are not able to repair themselves and hence will be broken down once they are no longer able to carry out their functions effectively         | 1 |
|   |     |                                                                                                                                                   |   |
|   |     |                                                                                                                                                   |   |
| 3 | (a) | Carbon dioxide + water $\xrightarrow[\text{chlorophyll}]{\text{sunlight}}$ glucose + oxygen                                                       | 1 |
|   |     |                                                                                                                                                   |   |
|   |     | (b) Glucose converted to sucrose,                                                                                                                 | 1 |
|   |     | Transported from the leaves to the rest of the plants.                                                                                            | 1 |
|   |     | Oxygen produced will diffuse out of the stomata of leaves.                                                                                        | 1 |
| 3 | (a) | (i) S: aorta                                                                                                                                      | 1 |
|   |     | T: hepatic portal vein                                                                                                                            | 1 |
|   |     | U: hepatic vein                                                                                                                                   | 1 |
|   |     |                                                                                                                                                   |   |
|   |     | (ii) It carries blood from one organ to another organ                                                                                             | 1 |
|   |     |                                                                                                                                                   |   |
|   |     | (b) Conversion of excess glucose to glycogen to decrease blood glucose level                                                                      | 1 |
|   |     | Conversion of glycogen to glucose to increase blood glucose level                                                                                 | 1 |
|   |     | Detoxification of harmful substances such as alcohol and other chemicals, etc                                                                     | 1 |
|   |     |                                                                                                                                                   |   |
| 3 | (c) | Enzyme (amylase) is the lock while substrate (starch) is the key.                                                                                 | 1 |
|   |     | The starch molecule will fit into the active site of the amylase, and                                                                             | 1 |
|   |     | form the enzyme-substrate complex,                                                                                                                | 1 |
|   |     | where the starch is broken down to form maltose which is the product of the reaction.                                                             | 1 |
|   |     |                                                                                                                                                   |   |

|   |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                                                                                                                                                          |                                |
